Customer Experience Analysis and Final Strategic Recommendations

1. Voice of Customer (VoC) Analysis Results

Imagine an analysis of our customer support (CS) tickets and Net Promoter Score (NPS) data has been completed. The findings reveal critical issues in how customers understand our credit product.

- **High Ticket Volume:** A significant portion of customer queries—nearly **50% of total tickets**—are related to confusion about billing statements.
- **Key Pain Point:** The primary source of confusion is the concept of **revolving credit**. Customers who make the
- **minimum payment** often do not realize that interest is then charged on the entire balance from the date of purchase, not just on the remaining amount after their payment. This leads to unexpectedly high interest charges in the next billing cycle.
- **Impact on Satisfaction:** This misunderstanding is the leading driver of negative NPS feedback, with customers frequently citing "hidden charges" or "unexpected fees," indicating a critical communication gap. When payments are missed, the account becomes
- **delinquent**, further damaging the customer relationship and their credit score.

2. Proposed Solutions

Based on this VoC analysis, two initiatives are proposed to improve customer experience and retention:

- **A) Proactive, Personalized Communications:** Implement a system of personalized in-app notifications and email summaries. For example, a notification sent a few days before the due date could state: *"Paying the full ₹10,000 avoids all interest. Paying only the minimum of ₹500 will result in ₹291 of interest on your next statement."* A similar program focused on targeted communication has been shown to increase the Call-to-Action (CTA) response by **81.5%**.
- **B) Enhance Platform Reliability (Tech Excellence):** To build trust, the user experience must be seamless. We will map the **Time to Interactive (TTI)** and **Time to Paint (TTP)** for all screens in the payment and statement-viewing user journeys. This will identify and eliminate performance bottlenecks, ensuring the platform is fast and reliable when customers need it most.
